

Sounds Rather Incredible.

Prof. Lucien I. Blake of the Kansas State university delivered the twelfth lecture of his series on "Electricity and Its Modern Appliances" at the Y. M. C. A. auditorium last evening. He spoke last night more especially on "The ether and the electro-magnetic theory of light, electrical radiations and the vortex theory of matter."

By means of these oscillations, which were explained, man might in time, said the speaker, communicate with each other from the most distant places on the globe and through all barriers without visible means of communication. The lecturer made several interesting experiments.
